KijaniKiosk Capstone (Track A): Pipeline Demonstration Evidence

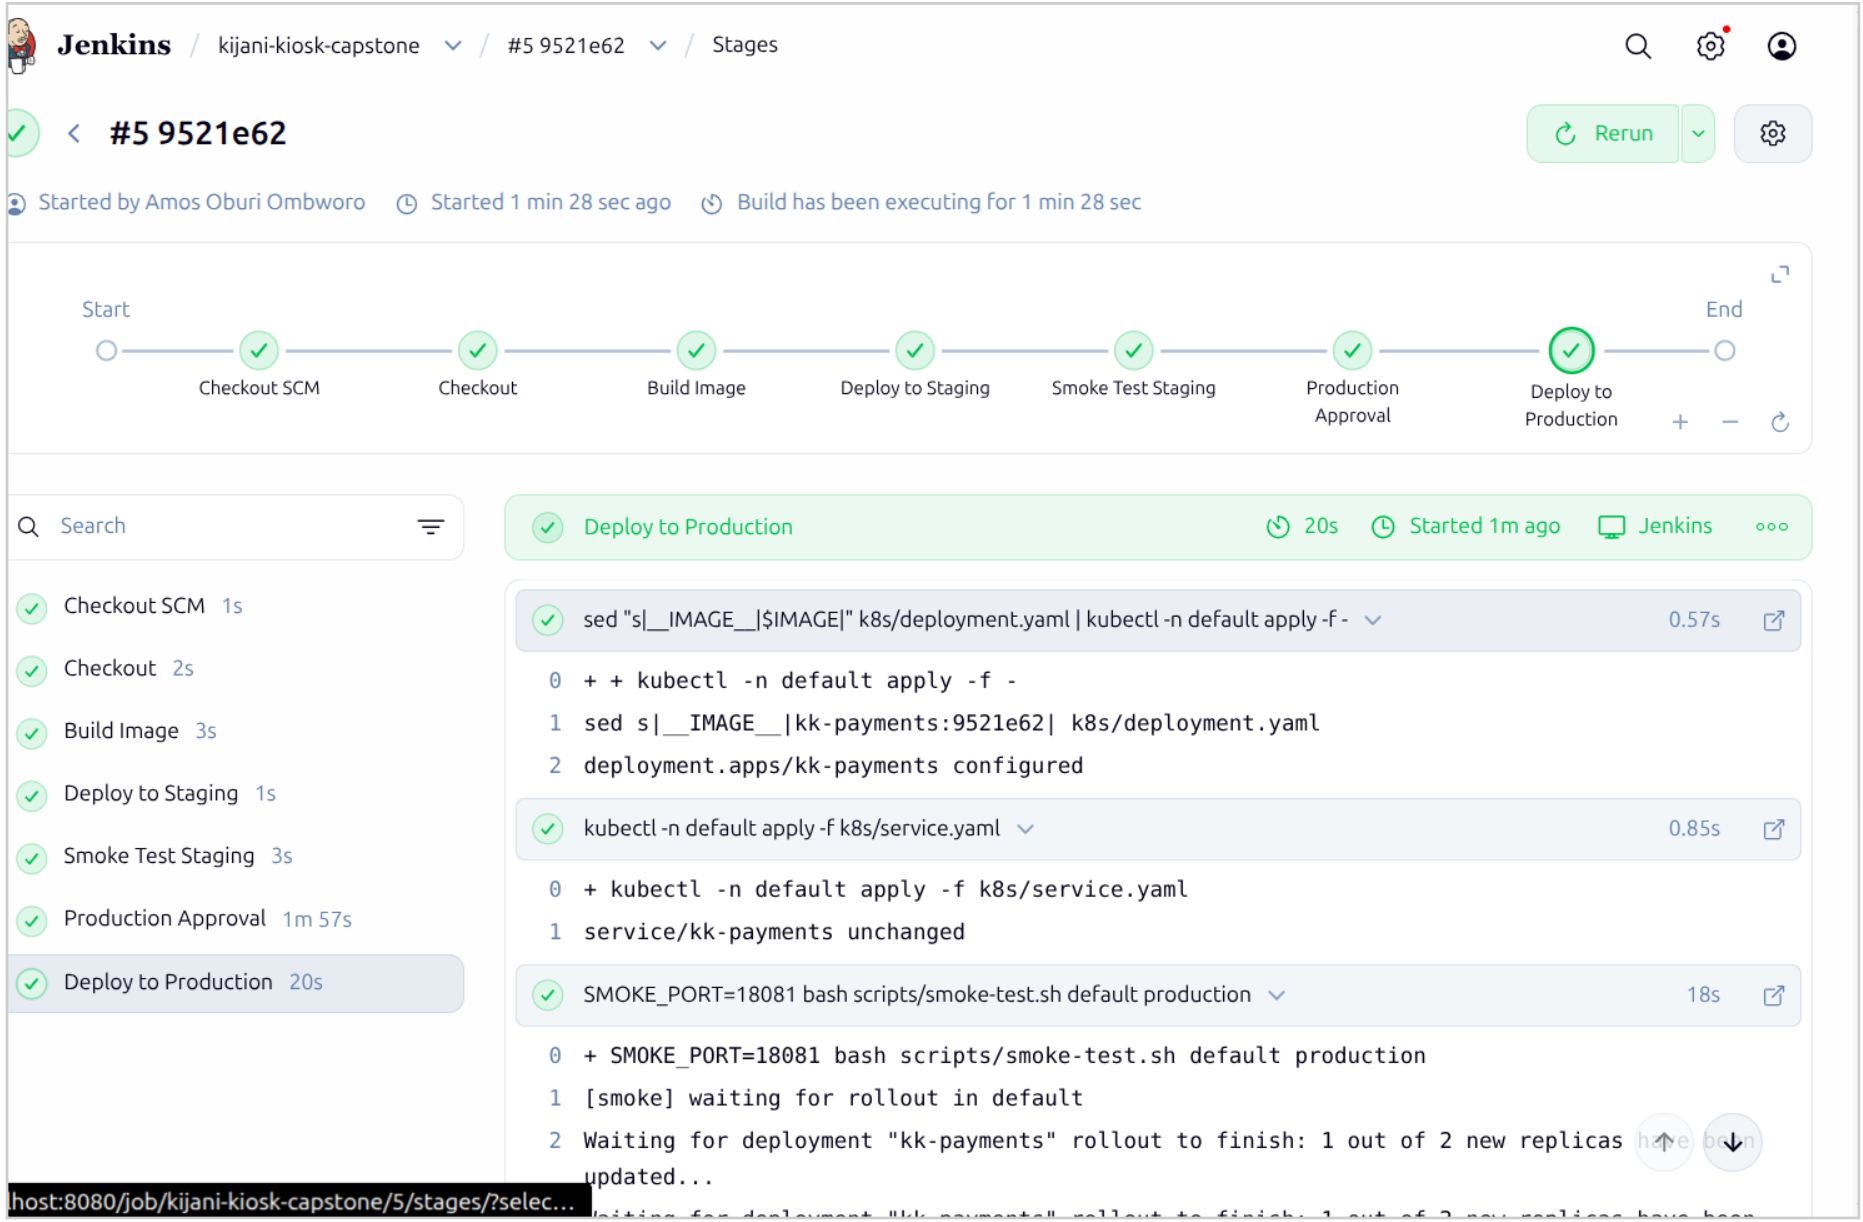

Amos Ombworo · github.com/ob002/kijani-kiosk-capstone · release v1.0.0

Screenshot sequence: staging deploy, approval gate, production deploy, fault handling, alerting, feedback.

All screenshots were captured from the live system on 2026-11-14.

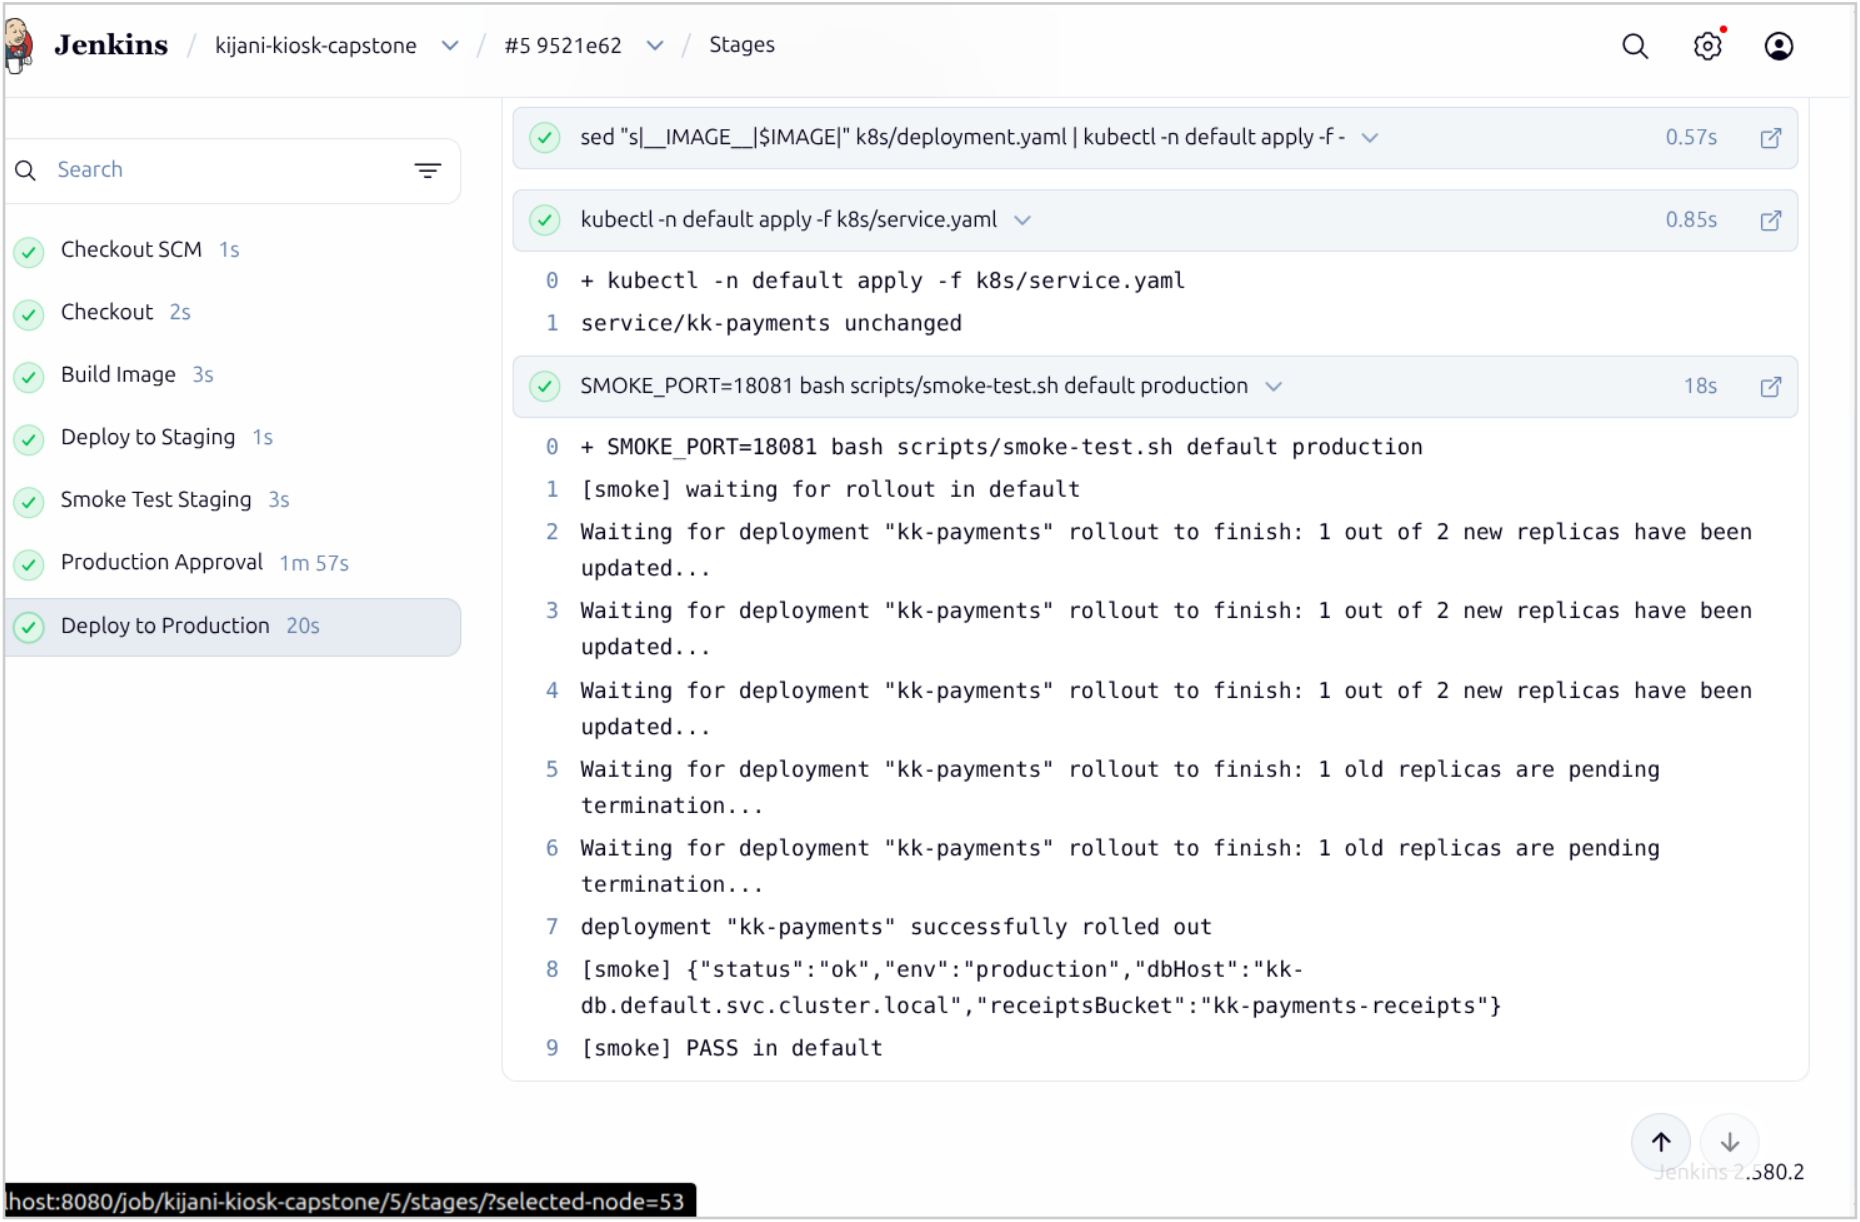

1. Build #5: full pipeline green, staging to production

Checkout → Build Image (kk-payments:9521e62) → Deploy to Staging → Smoke Test Staging → Production Approval (approved after 1m 57s, reason recorded) → Deploy to Production. All stages green.

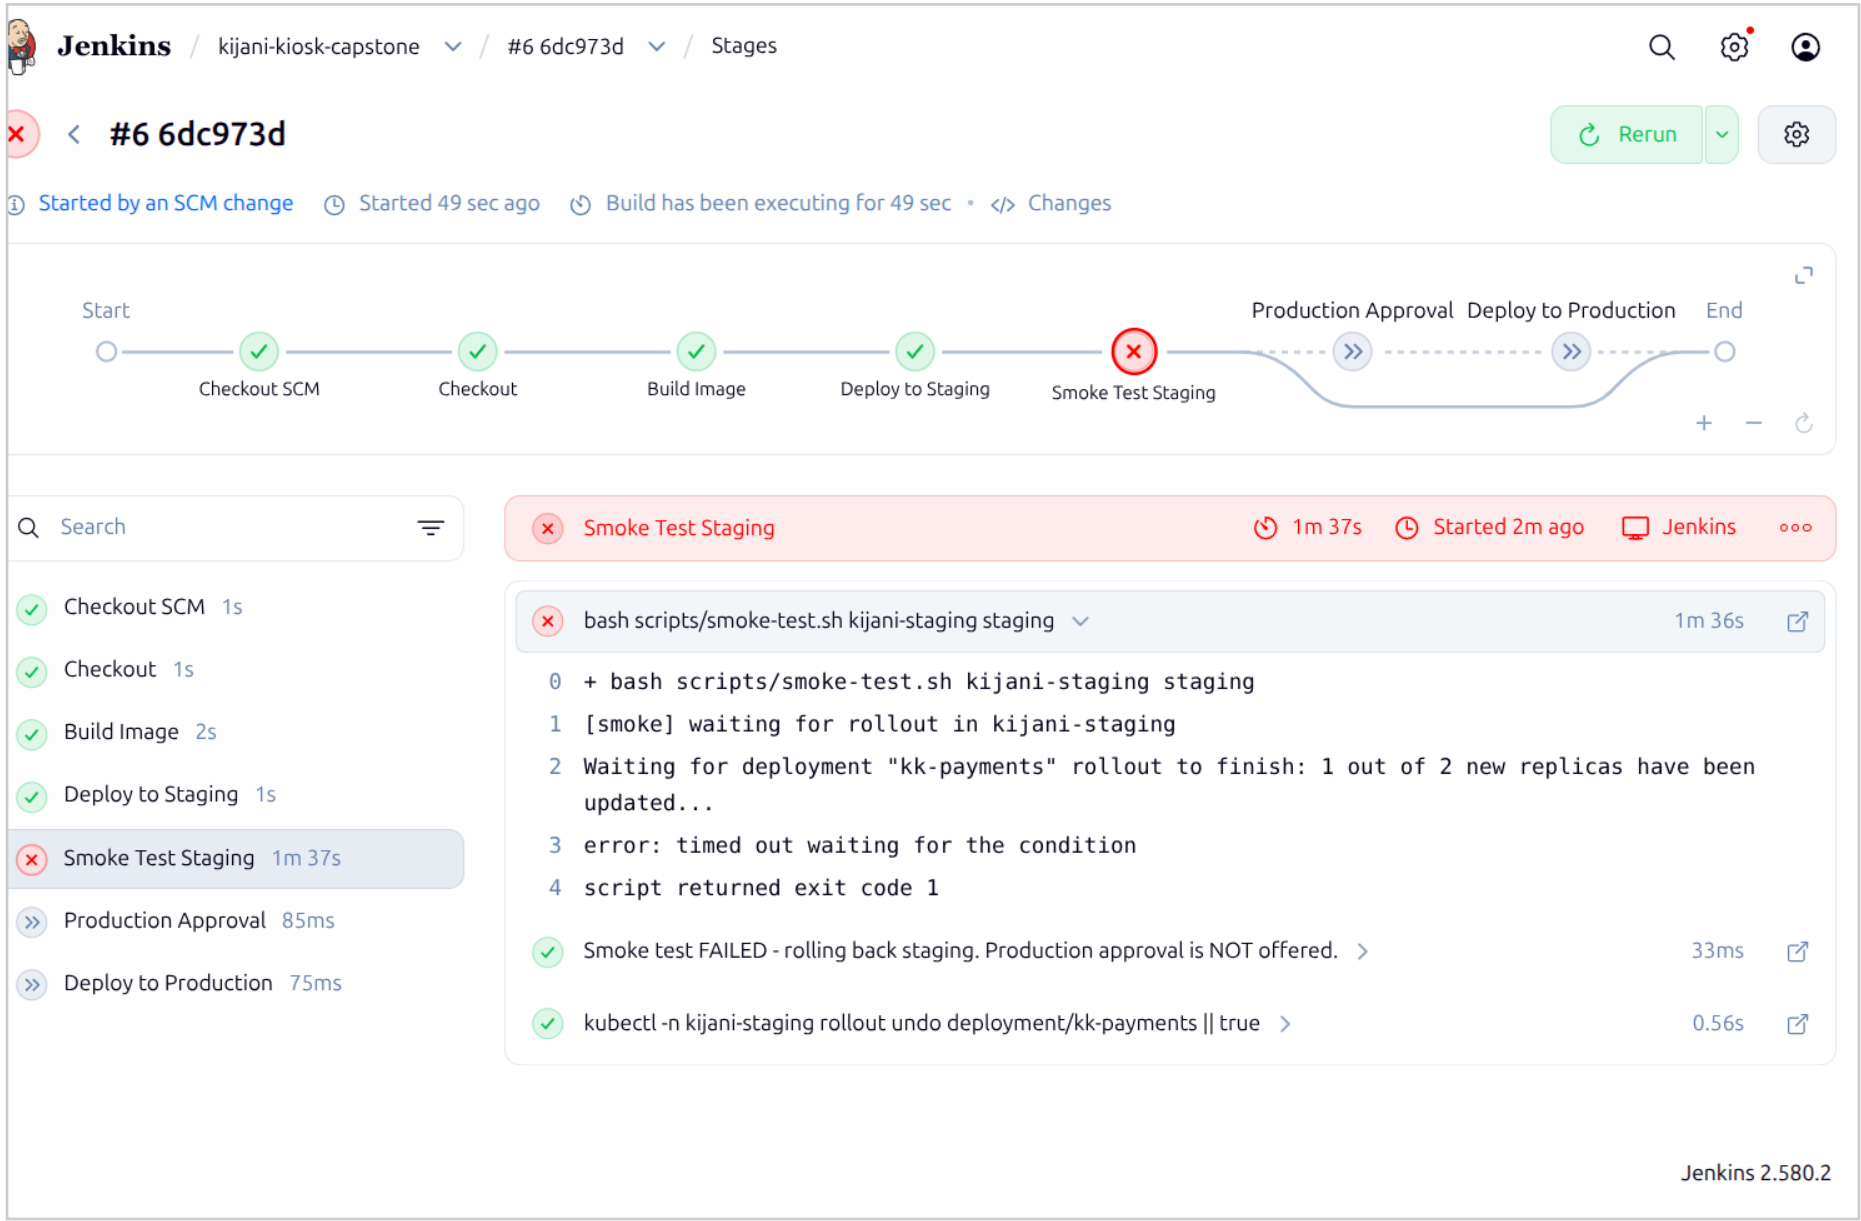

2. Build #5: production deploy and production smoke test

The same deployment.yaml applied to namespace default. Production smoke test returned {"status":"ok","env":"production","dbHost":"kk-db.default.svc.cluster.local"} → PASS.

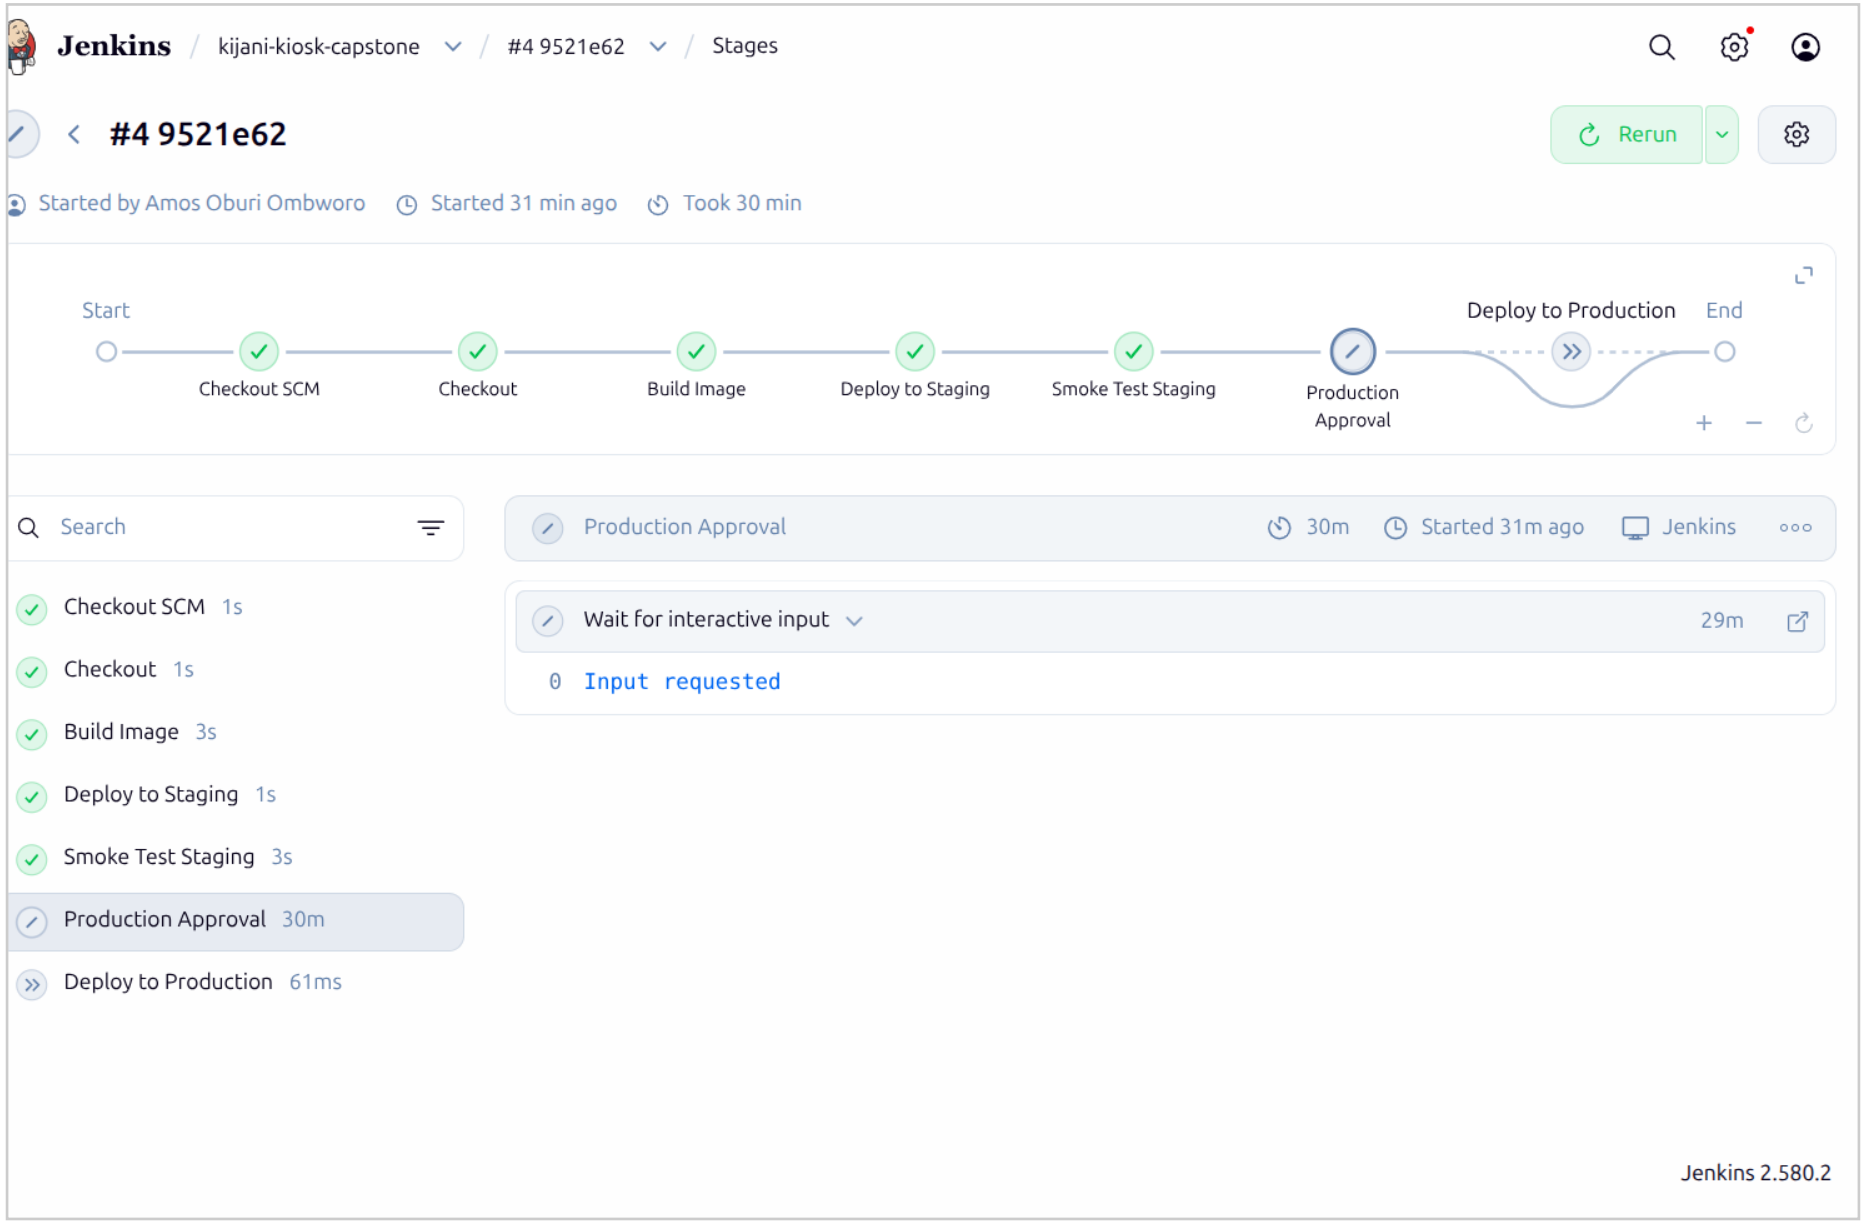

3. Build #6: deliberate fault, gate never offered

"Started by an SCM change": merging PR #3 (probe path set to /broken) triggered the pipeline automatically. Smoke Test Staging failed, staging was rolled back, and Production Approval / Deploy to Production were skipped.

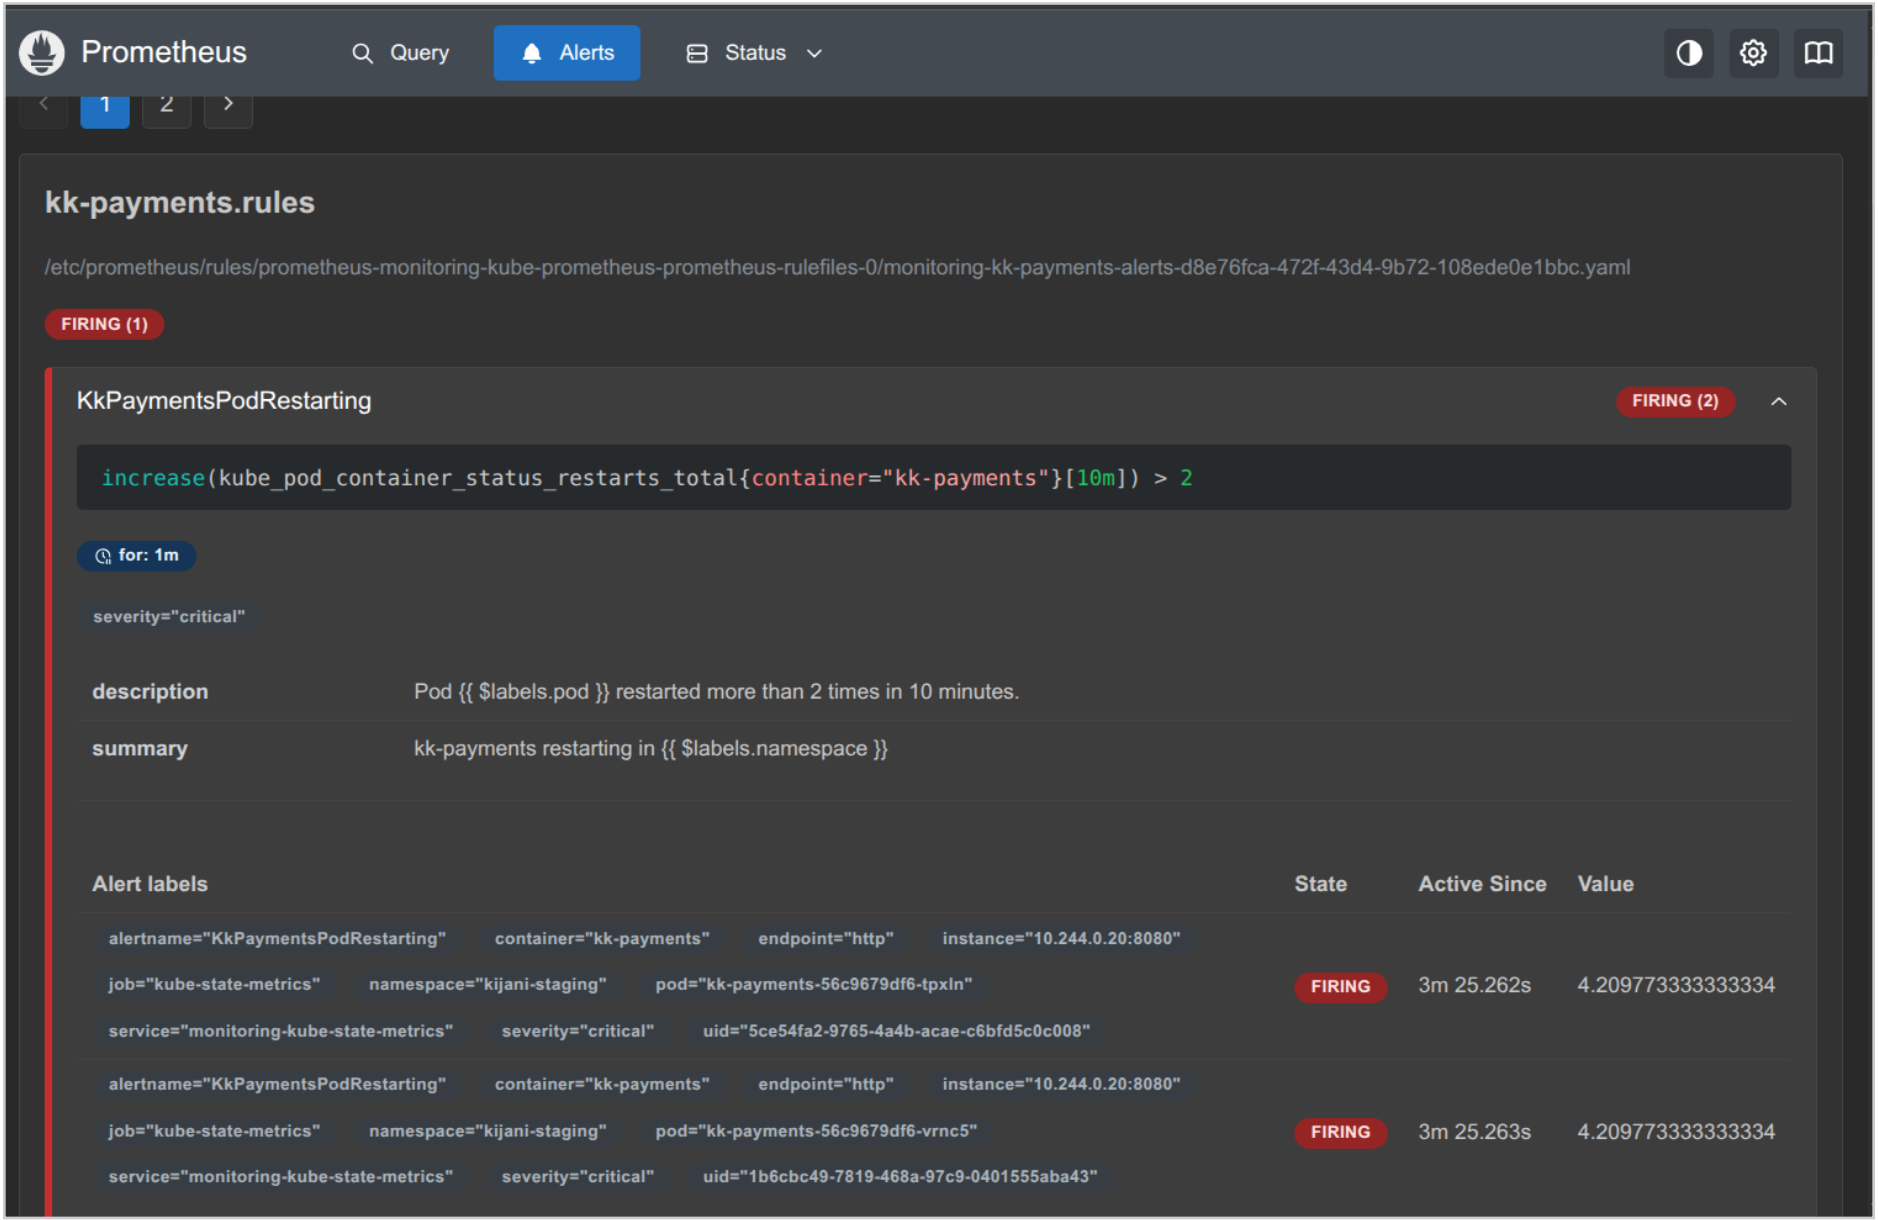

4. Build #4: approval gate is a real blocking step

Build #4 reached the Production Approval gate ("Input requested") and waited. No one approved within the 30-minute timeout, so it ended ABORTED and production was not changed. Logged as Issue #8.

5. Prometheus: KkPaymentsPodRestarting FIRING

After the liveness probe was broken in kijani-staging, the pods restarted 5 times. The alert fired for both staging pods (source: kube-state-metrics).

6. Feedback log: GitHub Issues #7–#9

#7 fixed by commit 977862a (PR #11). #8 resolved by documentation (README §5). #9 closed as not planned (production gap).
